ArthriKal I and II

ArthriKal - I: 50 ml Bottle of oily lotion and

ArthriKal - II: Box of 90 capsules

Is a two prong approach made of complementary treatments, an oil rich in herbal active ingredients (oily lotion) and a complex blend of herbs (capsules) to reduce the inflammations located at the articulations and thus relieving the pains associated with inflammatory rheumatic problems and arthritis. For maximum efficiency, it is preferable to undertake a cure with both products.

Some facts on the articular pains:

The articular pains have at the same time many and varied causes. Thus name rheumatism includes any painful, acute affection or chronicle which obstructs articular operation.

Under this ensign one finds infectious rheumatisms (gonococcal arthritis or tubercular arthritis), rheumatisms due to the proliferation of bacteria inside the articulations, inflammatory rheumatisms (rheumatoid poly arthritis, psoriasis arthritis), microcrystalline rheumatisms (gout, calcifications of the tendons) or degenerative rheumatisms (osteoarthritis of the limbs, herniated disk). Each form of articular problem must be identified clearly to be treated in a suitable way. It is therefore necessary to obtain an opinion from qualified medical personnel.

The articular pains have many and varied causes and the name rheumatism includes any painful affection, acute or chronicle which obstructs articular movement operation. Under this umbrella one finds infectious rheumatisms (gonococcal or tuberculosis arthritis), inflammatory rheumatisms (rheumatoid poly-arthritis, psoriatic arthritis), microcrystalline rheumatisms (gout, calcifications of the tendons) or degenerative rheumatisms (osteoarthritis of the limbs).

Each form of articular problem must be identified clearly to be treated in a suitable way. It is thus necessary to obtain an opinion from competent medical personnel.

Arthritis in short:

One can call arthritis any inflammatory affection acute or chronic regarding the articulations. The various forms of arthritis have their own symptoms and their own evolution which vary considerably according to individuals. Arthritis is characterized by an alternation of outbreaks and remission periods, even if the disease is chronic. It is to consider however that the swelling, the stiffness, the pain and redness of the articulations are common to all types of arthritis. Generally, the pain and the stiffness are more severe in the morning or only on certain days.

Here are some of the main causes of arthritis; the arthritis resulting from autoimmune reactions, or the arthritis caused by infections, accumulation of deposits or by a physical or mechanical trauma. On top of that we can add the genetic background, a sedentary lifestyle and eating habits.

In all cases, it is about an inflammatory response of the articulations, that may concern the cartilaginous tissue directly, the synovial envelope of the articulation, or the muscles and tendons near the articulations.

The majority of the arthritic diseases are chronic and some are degenerative (i.e. they involve the deterioration of certain parts of the body- the cartilage and bones). The problem arises when the inflammation persists in an intense and recurring manner or when it extends to other zones from the body. The inflammation triggers the stiffness and a degradation of the articulation structures. The stiffness also decreases the mobility of the articulation and the muscles which surround it begin to atrophy, accelerating even more the progression of the disease. With time, the cartilage starts to weather, the bone wears and the articulation becomes deformed.

The rheumatoid poly arthritis is the most frequent of the inflammatory chronic rheumatic diseases of the adult. It concerns 2 to 3% of the occidental population, and women are three times more prone to this condition. Generally, the disease appears between 30 and 60 years of age.

Action of the ArthriKal treatment:

Is a two prong approach made of Capsules and a complementary Lotion. For maximum efficiency, it is preferable to undertake a cure with both products.

ArthriKal-I is a penetrating oily lotion which alleviates the pain by reducing the inflammations of the tendons, the muscles and the ligaments.

ArthriKal-II is a complex compound of plants which reduces the inflammations of the articulations, with an internal and direct action on the cartilaginous tissue. It also allows the dissolution of calcareous or uric acid crystallizations, while balancing the acidity level in the blood in order to reduce the problem of crystallization at its source. It also fights articular infections with antiseptic plants.

ArthriKal I and II do not contain any corticosteroids for the treatment of inflammations; therefore there are no risks for bones demineralization, which would weaken furthermore the functional capacity of the articulations.

Instructions:

ArthriKal- I: Apply the lotion directly onto the area that hurts, 2 to 3 times a day. Rub well, in order for the lotion to penetrate. IMPORTANT: After the application of the lotion, let it evaporate, **do not cover** the area with a tight bandage (or a wristwatch). One can put on loose clothing, but nothing tight where the lotion was applied until it has evaporated. **For topical use only.**

ArthriKal- II: Take 3 capsules per day during 30 to 60 days, according to the severity of the situation. Thereafter, take two capsules per day. When the pain and the embarrassment disappear, continue the treatment for 10 more days. Repeat this treatment when needed.

Composition:

ArthriKal-I: lea Europaea Fruit Oil, Laurus Nobilis Leaf Oil, Anacyclus Pyrethrum Root Extract, Rheum Officinale Stem Extract, Curcuma Longa Rhizome Extract, Parfum, Benzyl Alcohol, Benzyl Benzoate, Eugenol, Linalool, Geraniol, Limonene.

ArthriKal-II: Peganum harmala, Ammi visnaga, Urtica dioica, Vicia sativa, Rheum officinale, Emblica officinalis, Foeniculum officinale - Plant origin capsules.

Complementary Treatments

OsteoParine: To fight against osteoporosis and bone demineralization.

DynOrgan: Eliminates toxins and boosts the internal organs (liver, kidneys, spleen, gall bladder) Facilitate the elimination of crystallizations and the control the uric acid.
